

# MultiProFit: galaxy fitting status update

Dan Taranu

August 11, 2022

# Intro & Summary

---

What is MultiProFit?

Multi-band parametric galaxy fitting, replacing CModel/meas\_modelfit

Previous results from MultiProFit:

Reasonable photometry & sizes in DC2 & HSC-RC2

Current status:

Improving performance; full re-write in C++ w/pybind11 bindings; using GSL

Future plans:

Flexible models via pex\_configs, new PipelineTasks, better priors, re-test deblending...

# MultiProFit

## Multi-band parametric fitting

### Features:

- Gaussian mixture Sersic profile (not just  $n=1$ ,  $n=4$ )
- Analytic gradients
- Flexible PSF & source models
- Parameter transforms
- Linear flux optimization

### Downsides:

- Slower than `meas_modelfit`
- No shapelet PSF

# Why MultiProFit?

---

## Practical:

- More accurate sizes/magnitudes than Scarlet\* (it depends)
- Gaussian mixtures = analytical convolution & gradients, so always fast (if done right)
- Infinite resolution deconvolved model (sampling still an issue)

## More Philosophical:

- Elliptically-symmetric, monotonic models probably better for smooth, barely resolved galaxies, and low surface brightness outskirts (PSF and galaxies)
- Parametric models can have advantages if parameter values are meaningful
- Why not? Multiple, different methods always useful

# DESC DC2 (Rubin Data Preview) magnitudes

DC2 3828 Resolved r-band, Scarlet, N=130895

2 3828 Resolved r-band, MPF Sersic(griz), N=130741

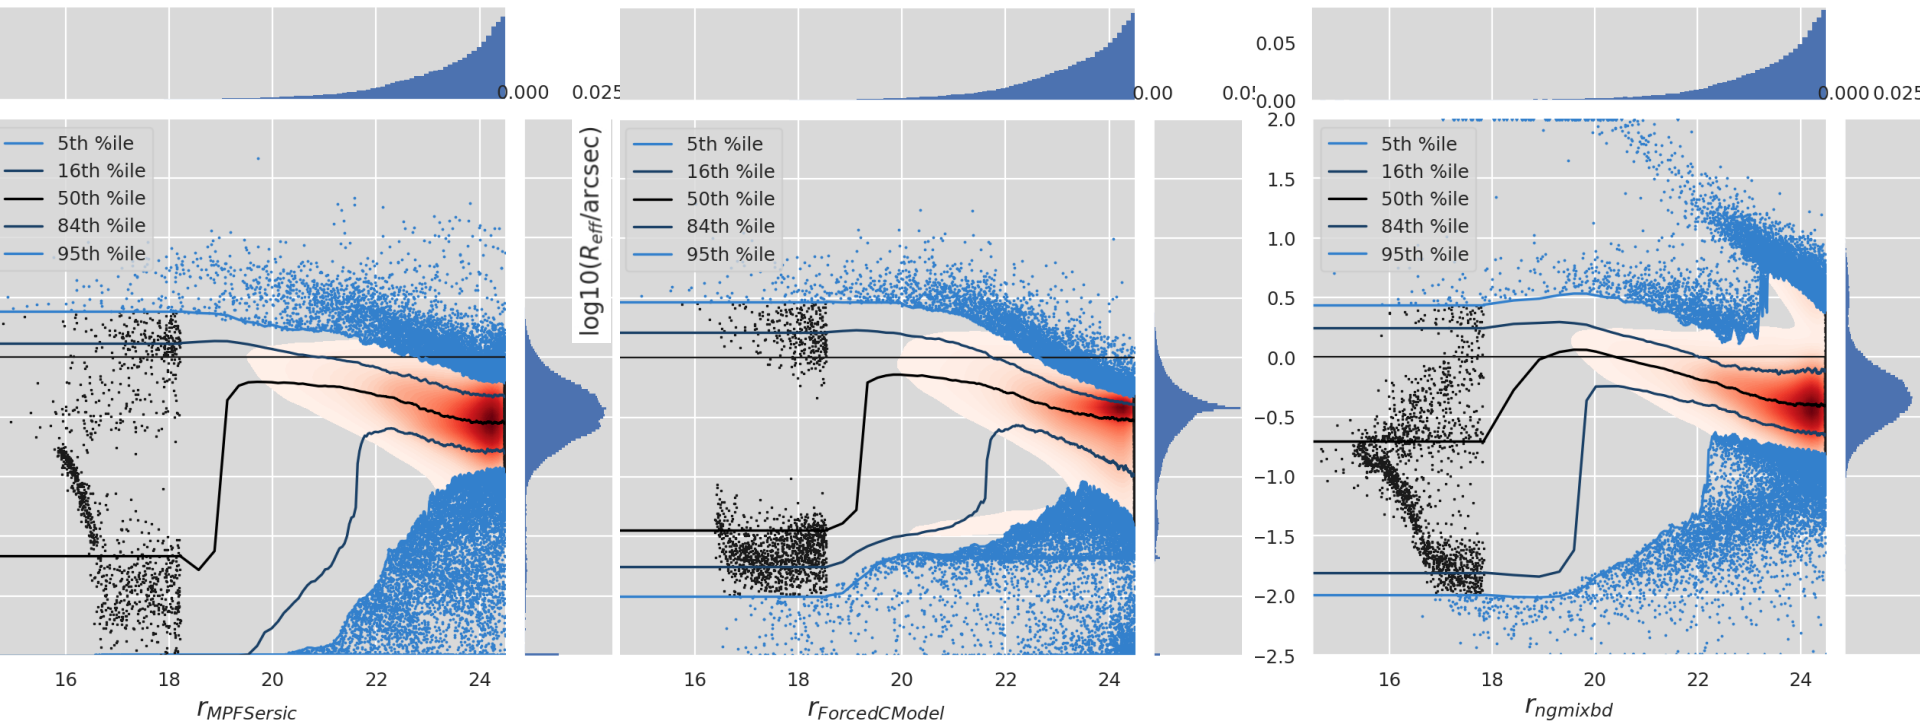

3 3828 Resolved r-band, MPF CModel(griz), N=130741

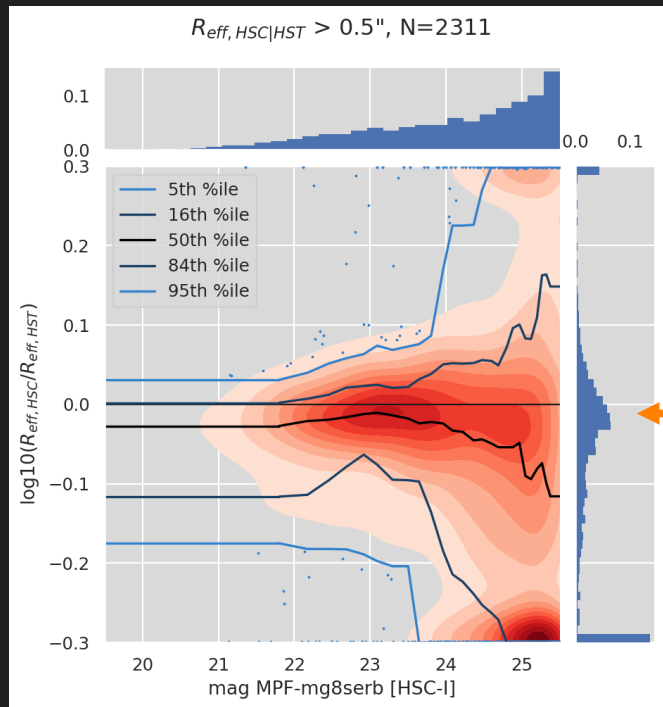

# DESC DC2 (Rubin Data Preview) sizes

3828 Size-Magnitude MPF Sersic (griz) N=162254 328 Size-Magnitude Forced CModel (griz) N=158285 DC2 3828 Size-Magnitude ngmix bd (griz) N=167493

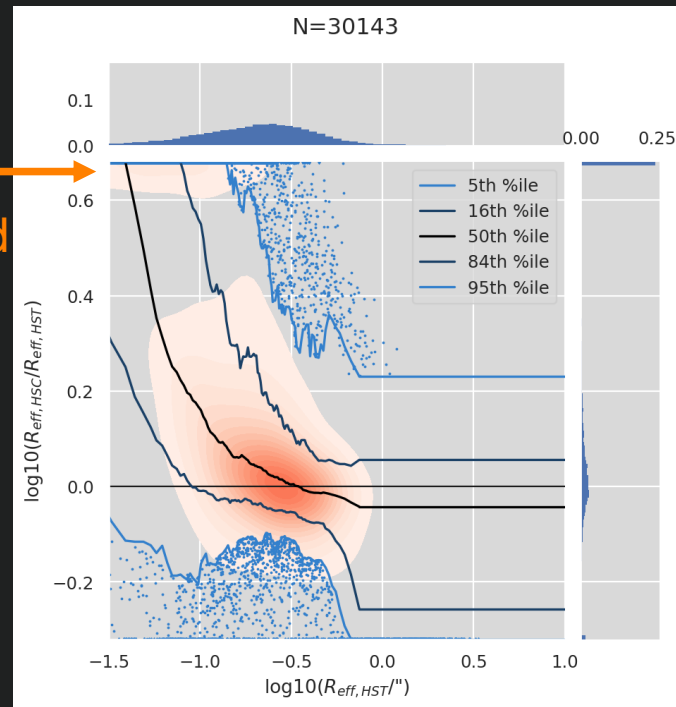

# COSMOS: HSC UDeep vs HST sizes

Most outliers  
unresolved

Most galaxy  
sizes  
ok-ish

Too faint in  
HST?

# COSMOS: Problems, opportunities

- Science opportunities and precursor for Rubin + Euclid/Roman.
- Need reliable joint source catalog and/or deblending

# Current Developments

---

MultiProFit was too slow (~10x slower than CModel; similar to ngmix)

Complete refactoring of Python interface into separate C++ packages built w/Meson:  
parameters, gauss2d => gauss2dfit => multiprofit (all on [github.com/lsst-dm](https://github.com/lsst-dm))

3-band Sersic now much speedier:

$20^2$  pix: 1 vs 12ms |  $35^2$ : 3 vs 15 ms |  $100^2$ : 22 vs 38ms (~10 ms floor for old code)

Currently re-implementing gradients and fitting; testing GSL optimizers next

Multi-scale fitting will be possible soon (specify pixel scale and fit sizes in arcsec)

# Future Developments (Conclusion)

---

Model configuration with `pex_config`: easier testing of different models

Completely restructure PipelineTasks into modular format:

- Separate PSF + model fitting tasks
- Separate simultaneous multi-source fitting (deblending) task, w/non-linear option

Test exponential/Sersic + point source (absorb unresolved central flux)

- Might implement pixel grid point sources in addition to Gaussian mixture

Better priors (size priors, color priors, bimodal/conditional on whether resolved)

Try non-linear deblending again, hopefully on larger scales

# DESC DC2 (Rubin Data Preview) g-r colours

DC2 3828 Resolved g-r, Scarlet, N=130895

DC2 3828 Resolved g-r, MPF Sersic(griz), N=130741

DC2 3828 Resolved g-r, Forced CModel, N=130520
